

We believe that children are naturally curious, trying to make sense of their world in which they live.

In our school we believe that science should provide practical and investigational activities which allow children to engage in active learning; enabling them to broaden their experiences and develop their scientific skills whilst retaining their sense of wonder.

Hands-on science helps our children to think critically and gain confidence in their own ability to solve problems. Children will predict and then explore questions on a number of topics, they will work collaboratively and co-operatively with their peers to build skills around scientific enquiry.
